Performance Testing

Date	01 October 2026
Team ID	SWTID-2026-3953
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	Marks 5

Performance Testing

This project implements Client Scripts and UI Policies in the ServiceNow Incident form to improve data validation, field visibility, and user experience while creating or updating incident records.

Step 1: Testing Overview

Field	Details
Testing Tool Used	ServiceNow platform / browser-based testing
Type of Testing	Functional Testing
Target Module / API	Incident Management → Incident Form → Client Scripts → UI Policies
Test Environment	ServiceNow development instance
Test Date	September 30 2026

Step 2: Test Scenarios

S.No	Test / Scenario Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	Open the Incident form	10	60	Incident fields are displayed correctly.
2	Select a priority or impact value	10	60	Related fields respond according to the configured Client Script.
3	Leave the Short Description field empty and submit	10	60	Validation message is displayed, and submission is prevented if required by the script.
4	Change the Incident State	10	60	UI Policy makes specified fields visible, mandatory, or read-only according to the configured conditions.

Step 3: Performance Test Results

S.No	Metric	Expected Result	Status
1	Client Script Execution	Script executes according to configured conditions.	To be tested
2	Field Validation	Invalid or missing input is handled correctly.	To be tested
3	UI Policy Execution	Fields become visible, mandatory, or read-only as configured.	To be tested
4	Form Submission	Valid incident records can be submitted successfully.	To be tested
5	Error Handling	Appropriate validation messages are displayed.	To be tested

Step 4: Observations & Analysis

: Key The Client Scripts validate incident fields, while UI Policies control field behavior dynamically based on set conditions.
:Bottlenecks Identified Conflicting Client Scripts and UI Policies may cause unexpected field behavior, while incorrect conditions can prevent fields from updating properly.
:Optimization Steps Taken Simplify Client Scripts, avoid conflicting UI Policies, and use clear conditions to ensure smooth and consistent field behavior.

Step 5: Screenshots / Evidence
